Exhibit A – Sewer Master Plan

INTRODUCTION

General Description

The Talking Rock Ranch (TRR) Subdivision consists of residential and recreational facilities. This planned area development (PAD) was approved by the Yavapai County Board of Supervisors on October 6, 1999 and Amended on May 8, 2000. It is being developed in multiple phases. This report is provided for Phases 10, 12, and 13.

Talking Rock Ranch encompasses about 3,500 acres of undeveloped and newly developed land that slopes towards Inscription Canyon. The site, divided by Williamson Valley Road, consists of forested areas with slopes ranging from gentle to near vertical.

Project Location

The project site (Phases 10, 12, and 13) is located in the northern half of Section 15, Township 16 North, Range 3 West, Gila and Salt River Base and Meridian, Yavapai County, Arizona. The project is generally located in the Southern portion of Williamson Valley and lies to the east of Williamson Valley Road. See Appendix "A" for site map.

The site is surrounded by unsubdivided land of Talking Rock to the west and northeast, golf course tracts to the west and Phase 9 of Talking Rock to the south. Surrounding land use is single family dwellings with 1 to 5 acre lots. Average lot density within the TRR community is 2.3 acres and 2.7 persons per dwelling unit.

SYSTEM ANALYSIS

Low Pressure Sewer

The manufacturer of choice for the pressure sewer system is Model SGPC-AU, 1hp submersible grinder pump by Crane/Barnes Pumps. These systems use a traditional simplex pump within a fiberglass basin at each residence. Data sheets for the proposed pump configuration are included in Appendix "D". The impact of this type of system on the wastewater treatment plant will be minimal and consistent with other systems designed for previous phases of Talking Rock Ranch.

The pressure sewer piping analysis was performed utilizing spreadsheet and EPANet hydraulic modeling software. The spreadsheet computed line velocities and head losses in a tabular format. Several assumptions and system parameters were utilized in the analysis as shown below. The system was broken up into zones as shown in Appendix "C".

MODELING ASSUMPTIONS

| | | |
|--|------------------------|---------------------|
| Individual pumping rate | 11.0-16.0 | gpm |
| Service Elevation Range | 4937-5003 | ft |
| Max. probable pump cores operating simultaneously ⁽¹⁾ | No. of pumps connected | Max. number running |
| | 1 | 1 |
| | 2-3 | 2 |
| | 4-9 | 3 |
| | 10-18 | 4 |
| | 19-30 | 5 |
| | 31-50 | 6 |
| | 51-80 | 7 |

(1) Taken from Environment One Corporation, L.P. Sewer System Design Assistant

The velocity and friction head loss were calculated for pumps in simultaneous operation within the system. Based on the number of pumps proposed for this project and the chart above, one pump for each home, a maximum of seven (7) pumps on average will run simultaneously within a series of zones. Pressure sewer pipes were sized to create minimum flow velocities of 2.5 to 3.0 feet per second to keep solids in suspension. The analysis used a design flow of 270 gallons/day/housing unit and typical pump flow rate of 11.0 to 16.0 gallons/minute/housing unit. A Hazen-Williams C-Value of 140 was used for the pressure sewer system pipe.

Phase 10 consists of 117 lots with a total of 103 submersible grinder pumps, 14 lots will be serviced by gravity connections. Phase 12 consists of 86 lots with a total of 60 submersible grinder pumps and 26 lots will be serviced by gravity connections. Phase 13 has a total of 32 lots and all serviced with submersible grinder pumps.

The highest head encountered within the sewer system is 112 feet (Meriah Lane - Zone 25) which is below 138 feet, the maximum range of the selected pump. Average pressures throughout the system range between 16 and 48 psi. Due to this pressure, schedule 40 PVC pipe with test pressure of 150 psi is acceptable. The pump curve for the selected pump is included in Appendix "D".

Flushing connections for the pressure system will be located at the terminal end of each main, at intersections, at changes in pipe diameter, and at any sharp changes in direction. Intermittent spacing of inline flushing stations will be a maximum of 1,500 feet per the manufacturer. Air release valves will be placed at high points in the system to prevent air build-up.

Gravity Sewer

Gravity sewers were analyzed using Haestad Methods SewerCAD, version 5.6. The modeling software uses the Manning's formula to calculate friction losses for open channel flow. Manning's N values of 0.013 were used for all sewers in the model. Design flows for the gravity sewers were calculated based on ADEQ minimum flows of 100 gallons/day/capita with a peaking factor of 3. Peak design flows will be conveyed adequately using 8" sewers and maximum depths were less than 50% of the pipe capacity. All sewer lines will be 8" SDR-35 PVC with slopes ranging from 0.33% to 4.08%. Modeling results for the SewerCAD model are included in Appendix "B". Below is a summary for the gravity sewers within phases 10 and 12;

| Location | Length (linear feet) |
|-------------------|-----------------------------|
| Chloe Trail | 534 |
| Meem Lane | 1,085 |
| Double Adobe Road | 423 |
| Silent Moon Lane | 3,045 |
| Meriah Lane | 859 |
| Kenobi Trail | 615 |
| Total | 6,561 |

Silent Moon Lane Lift Station

A sewage lift station with duplex pumping is required near the intersection of Double Adobe Road and Silent Moon Lane. Based on the incoming flowrates, the pump station is capable of pumping 205 gpm at 86 ft TDH, with the largest pump out of service. A hydraulic analysis was completed for the lift station and force main. The force main will exit the lift station as a 4" line until it reaches Double Adobe Road, where it connects to a 4" force main from phases 17-19 and then becomes 6" which ultimately discharges into an existing manhole in Talking Rock Ranch Road. The pump curves and lift station details are included in Appendix "E". The lift station will be equipped with submersible non-clog pumps capable of passing a 3" sphere, an odor control unit, stub outs for future aeration system, alternating pump controls, level float switches, alarms, an automatic transfer switch, and a standby generator.

Existing Lift Station

The existing lift station is located adjacent to the maintenance building off Talking Rock Ranch Road and is the primary lift station for the subdivision, pumping 100 percent of the wastewater from Talking Rock to the Inscription Canyon Ranch WWTP (ICR WWTP). Based on submittal information supplied by the contractor who built the lift

station, the station is equipped with two (2) F.E. Myers model 4VE200M4-43 submersible non-clog wastewater pumps with the following criteria for each pump:

| | |
|------------------|--------------------|
| Design Flow | 150 gpm |
| Design Head | 115 ft. |
| Sphere Size | 3 in. |
| Efficiency | 35.1% |
| Motor Horsepower | 20.0 hp |
| Motor Speed | 1750 rpm |
| Electrical | 3 Phase, 460 Volts |
| Cable Length | 25 ft. |

The pumps listed above are installed in duplex configuration in an 8 ft diameter wet well, with an external valve box. The lift station pumps have 4" discharge piping which increases to the 8" force main downstream of the valve box. The force main extends approximately 7,950 feet to the ICR WWTP, ranging in elevation from 4,933 feet at the lift station to 5,000 feet at the WWTP.

Currently, flowrates to the lift station are minimal, only receiving wastewater from the Golf Pro Shop (Ranch Compound), the maintenance facility, and less than 50 private residences throughout the subdivision in phases 1, 2, 4, and 27. The expected wastewater flows to the lift station with a 2.5 peaking factor is estimated to be less than 30 gpm (43,200 gpd), which is within the capabilities of 1 pump with the second pump out of service.

As the subdivision continues to expand, the lift station will require improvements as future infrastructure contributes more wastewater to the system. The most critical improvement, not associated with added demand, is backup power. Currently, the lift station does not have a secondary power supply as required by A.A.C. R18-9-E301-D5g. A standby generator should be installed as soon as possible and electrical equipment modified to support the addition. The standby generator for the existing lift station should be a self contained unit capable of handling a load of 250 KW. This capacity should be adequate to serve the existing pumps along with the added future pumps.

Another improvement required within the next 6 months to a year is the addition of a magnetic flow meter to accurately record wastewater flows going to the ICR WWTP. The third major improvement will consist of adding additional pumping to the lift station, either in a separate wet well or modifying the existing one. It is unknown of the exact time to install additional pumping due to uncertainties of lot development, but it is estimated that current conditions will handle flows from up to 300 dwelling units, the Ranch Compound, and the maintenance facility. Development should be closely monitored to ensure the additional pumping is installed when needed.

CONCLUSIONS

The pressure sewer utilizing the 1 hp grinder pumps by Crane/Barnes is the preferred system based on the mountainous terrain characteristics of the site and consistency with other Talking Rock Ranch phases. Gravity sewers will also be utilized throughout the new phases as described above. The length of the low pressure mains and the number of units served dictate the need for a sewage lift station on Silent Moon Lane.

This system will serve 235 single-family lots with a combination of gravity and pressure sewer lines constructed of SDR 35 and schedule 40 PVC pipe.

| LEVEL CONTROL: | |
| AUF Series..... | On/Off & Alarm wide angle, PVC Mechanical normally open, Integral to pump. Custom molded quick connect for sealing and strain relief |
| AUE Series | SOLD SEPARATELY (See Accessory Section F page 23) Model ESPS-150, Environmentally sealed pressure switch with CPVC housing, Buna diaphragm, Custom molded quick connect for sealing and strain relief |
| OPTIONAL EQUIPMENT..... | Seal Material, Additional cord, Moveable Fitting |

Series: SGPC-AU 1HP, 1750RPM, 60Hz with Level Control

CSA 108 - File No. LR16567
UL 778
"AUF" series pump NOT UL or
CSA listed

DESCRIPTION:

THE GRINDER PUMP IS DESIGNED TO
REDUCE DOMESTIC SEWAGE TO A FINELY
GROUND SLURRY.

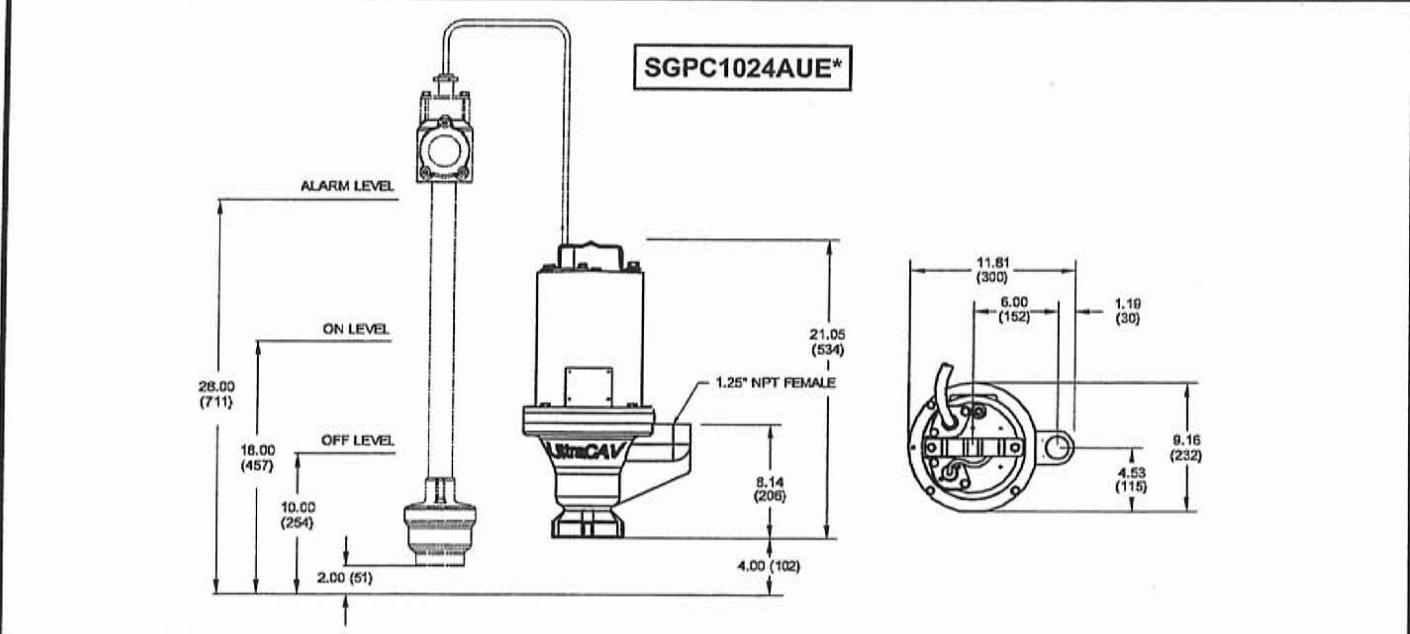

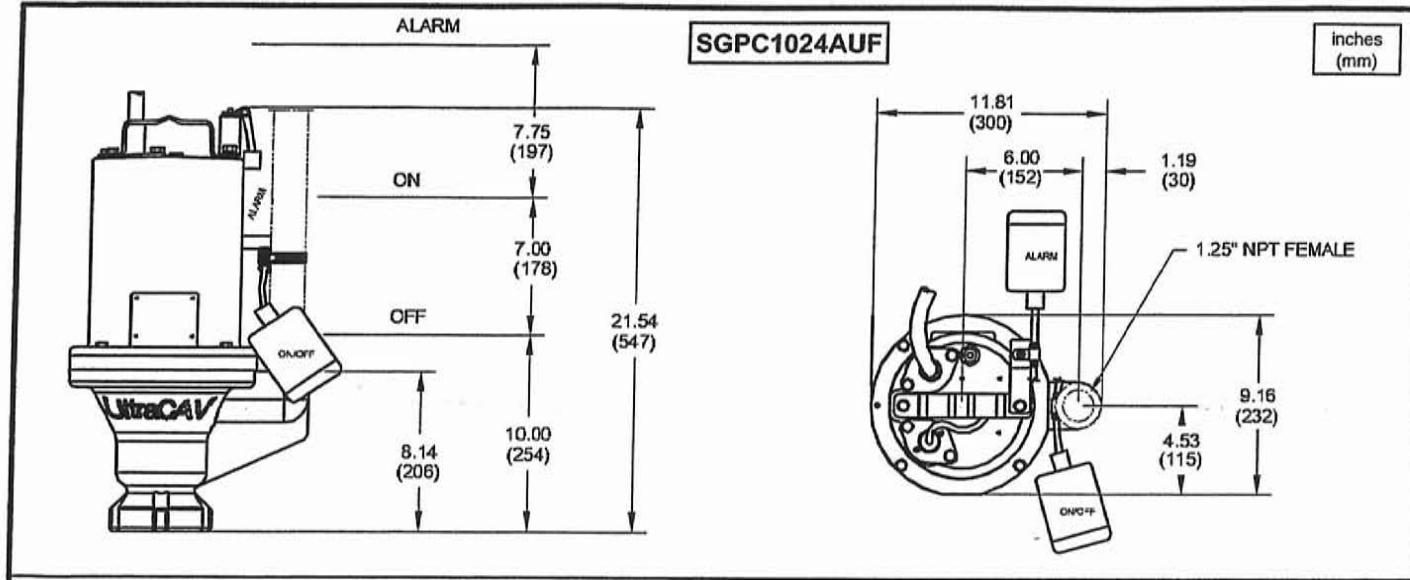

Models SGPC-AU

Progressing Cavity
with Level Control

IMPORTANT !

- 1.) PUMP MAY BE OPERATED "DRY" FOR EXTENDED PERIODS WITHOUT DAMAGE TO MOTOR AND/OR SEALS.
- 2.) THIS PUMP IS APPROPRIATE FOR THOSE APPLICATIONS SPECIFIED AS CLASS I DIVISION II HAZARDOUS LOCATIONS.
- 3.) THIS PUMP IS NOT APPROPRIATE FOR THOSE APPLICATIONS SPECIFIED AS CLASS I DIVISION I HAZARDOUS LOCATIONS.
- 4.) INSTALLATIONS SUCH AS DECORATIVE FOUNTAINS OR WATER FEATURES PROVIDED FOR VISUAL ENJOYMENT MUST BE INSTALLED IN ACCORDANCE WITH THE NATIONAL ELECTRIC CODE ANSI/NFPA 70 AND/OR THE AUTHORITY HAVING JURISDICTION. THIS PUMP IS NOT INTENDED FOR USE IN SWIMMING POOLS, RECREATIONAL WATER PARKS, OR INSTALLATIONS IN WHICH HUMAN CONTACT WITH PUMPED MEDIA IS A COMMON OCCURRENCE.

PS-015

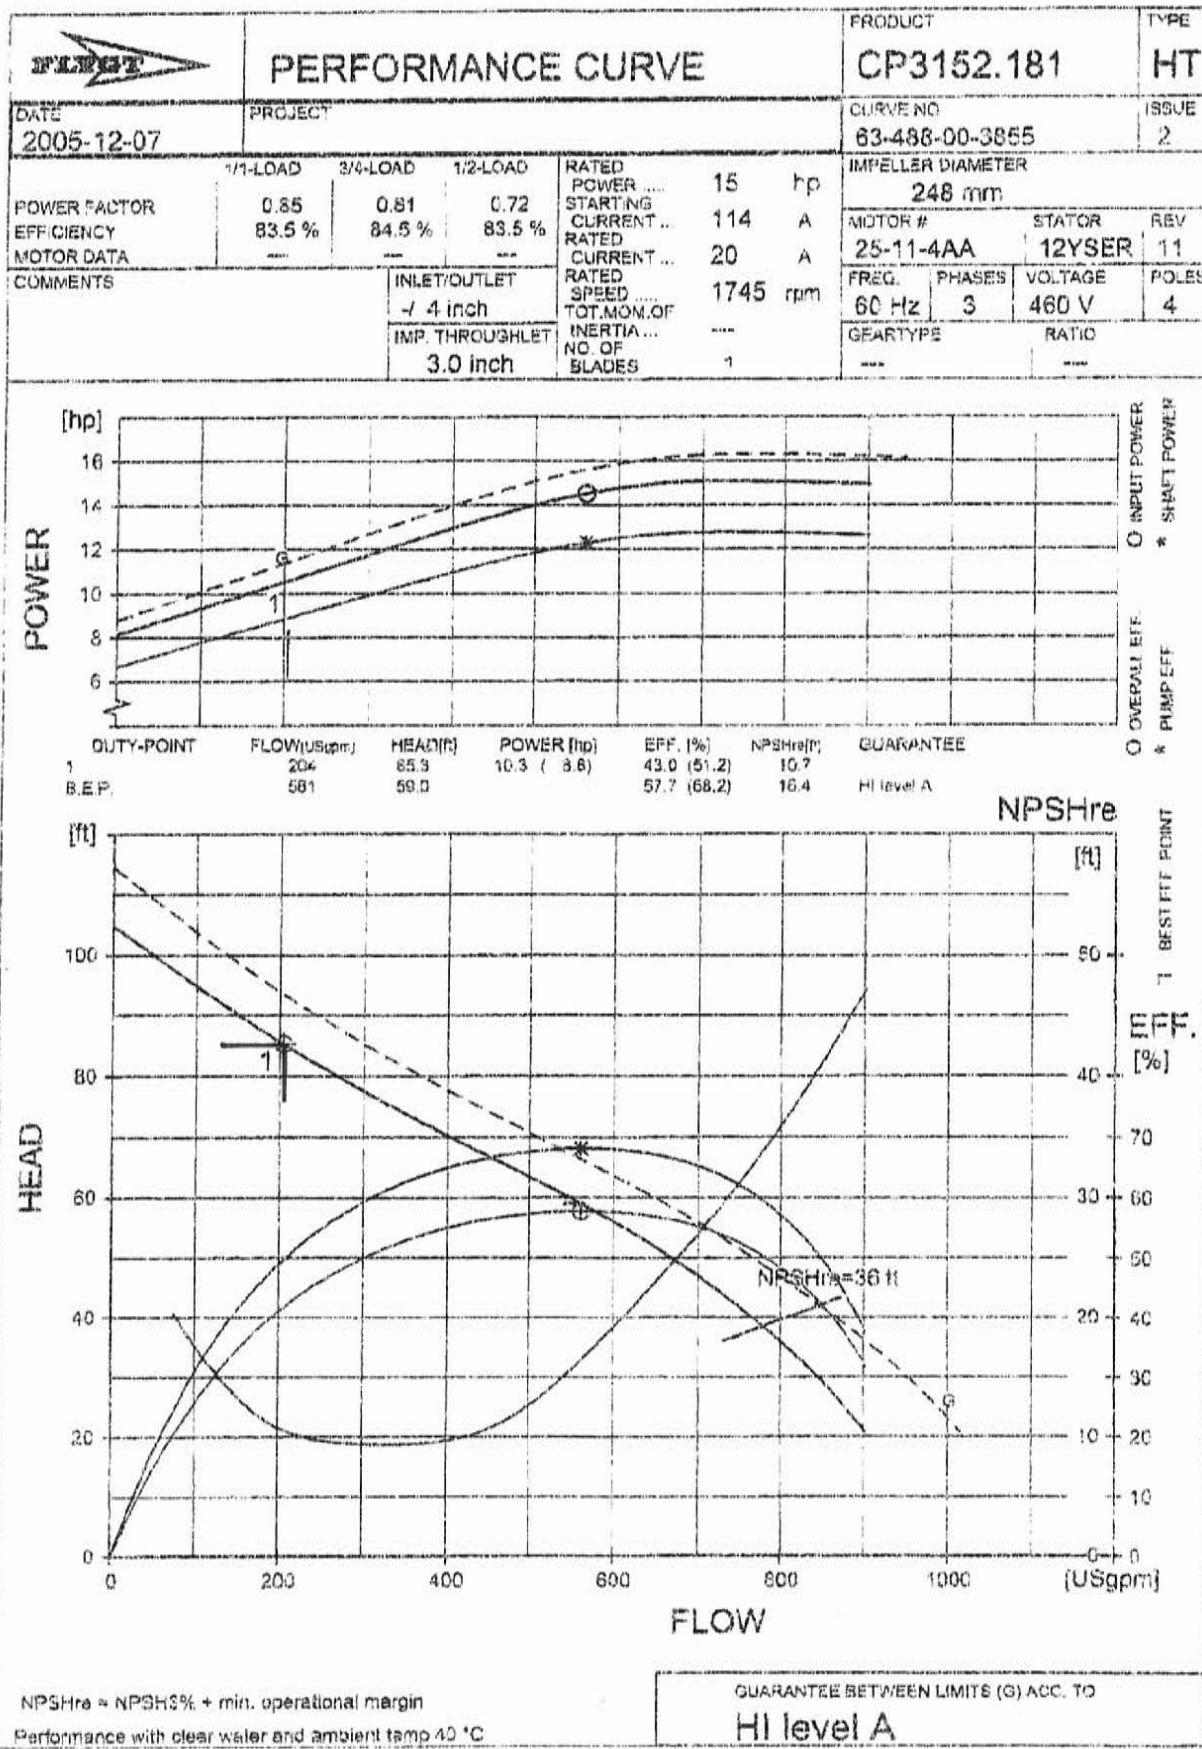

Submersible Grinder Pumps

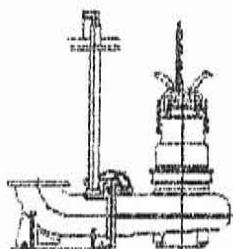

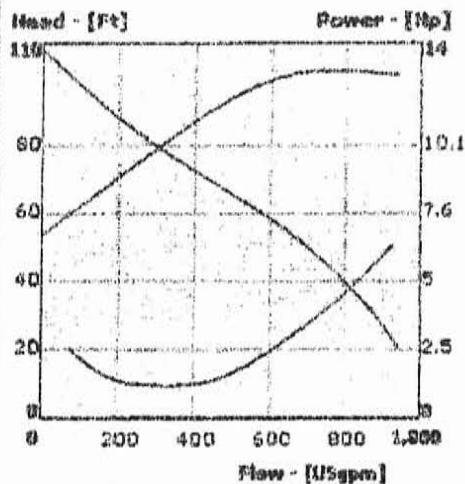

Testing is performed with water, specific gravity 1.0 @ 68° F @ (20°C), other fluids may vary performance

NOTES:

1. COVER SHOWN IS A STANDARD DUTY SAFE HATCH WITH ANGLE FRAME. FOR DIMENSIONS ON ACCESS COVERS WITH SAFE HATCH OR WITHOUT SAFE HATCH AS WELL AS HEAVY DUTY OR OTHER TYPES, CONSULT ITT FLYGT.
2. INSTALL ACCESS COVERS PER MANUFACTURER'S INSTRUCTIONS.
3. MIN. LIQUID LEVEL MUST NOT FALL BELOW TOP OF VOLUTE.
4. 60" RECOMMENDED.
5. OTHER MATERIALS AVAILABLE. CONSULT ITT FLYGT.
6. ITT FLYGT LIQUID LEVEL CONTROL MONITORING SYSTEM.
7. GOOD DESIGN PRACTICE DICTATES THAT INFLUENT PIPE ELEVATIONS HIGHER THAN LWL SHOULD BE AVOIDED DUE TO RISK OF AIR ENTRAINMENT, UNLESS SPECIAL ARRANGEMENTS ARE MADE.
